1-HETEROCYCLYL-1,5-DIHYDRO-PYRAZOLO [3,4-D] PYRIMIDIN-4-ONE DERIVATIVES AND THEIR USE AS PDE9A MODULATORS

The invention relates to novel 1,6-disubstituted pyrazolopyrimidinones, wherein i.) the nitrogen atom of the pyrazolo-group that is next to the pyrimidino-group is attached to a non-aromatic, organic heterocycle having at least one ring hetero atom selected from O, N and S and ii.) to the C-atom between the two nitrogen atoms of the pyrimidinone-ring a second substituent is bound via an optionally substituted methylene-bridge. According to one aspect of the invention the new compounds are for the manufacture of medicaments, in particular medicaments for the treatment of conditions concerning deficits in perception, concentration, learning or memory. The new compounds are also for the manufacture of medicaments for the treatment of Alzheimer's disease. Further aspects of the present invention refer to a process for the manufacture of the compounds and their use for producing medicaments.

## BACKGROUND OF THE INVENTION

- 15 The inhibition of phosphodiesterase 9A (PDE9A) is one of the currents concepts to find new access paths to the treatment of cognitive impairments due to CNS disorders like Alzheimer's Disease or due to any other neurodegenerative process of the brain. With the present invention, new compounds are presented that follow this concept.
- 20 Phosphodiesterase 9A is one member of the wide family of phosphodiesterases. These kinds of enzymes modulate the levels of the cyclic nucleotides 5'-3' cyclic adenosine monophosphate (cAMP) and 5'-3' cyclic guanosine monophosphate (cGMP). These cyclic nucleotides (cAMP and cGMP) are important second messengers and therefore play a central role in cellular signal transduction cascades.
- 25 Each of them reactivates inter alia, but not exclusively, protein kinases. The protein kinase activated by cAMP is called protein kinase A (PKA), and the protein kinase activated by cGMP is called protein kinase G (PKG). Activated PKA and PKG are able in turn to phosphorylate a number of cellular effector proteins (e.g. ion channels, G-protein-coupled receptors, structural proteins, transcription factors). It is possible in
- 30 this way for the second messengers cAMP and cGMP to control a wide variety of physiological processes in a wide variety of organs. However, the cyclic nucleotides

are also able to act directly on effector molecules. Thus, it is known, for example, that cGMP is able to act directly on ion channels and thus is able to influence the cellular ion concentration (review in: Wei *et al.*, *Prog. Neurobiol.*, **1998**, 56, 37-64). The phosphodiesterases (PDE) are a control mechanism for controlling the activity of cAMP and cGMP and thus in turn for the corresponding physiological processes. PDEs hydrolyse the cyclic monophosphates to the inactive monophosphates AMP and GMP. Currently, 11 PDE families have been defined on the basis of the sequence homology of the corresponding genes. Individual PDE genes within a family are differentiated by letters (e.g. PDE1A and PDE1B). If different splice variants within a gene also occur, this is then indicated by an additional numbering after the letters (e.g. PDE1A1).

Human PDE9A was cloned and sequenced in 1998. The amino acid identity with other PDEs does not exceed 34 % (PDE8A) and is never less than 28 % (PDE5A). With a Michaelis-Menten constant ( $K_m$ ) of 170 nanomolar, PDE9A has high affinity for cGMP. In addition, PDE9A is selective for cGMP ( $K_m$  for cAMP=230 micromolar). PDE9A has no cGMP binding domain, suggesting that the enzyme activity is not regulated by cGMP. It was shown in a Western blot analysis that PDE9A is expressed in humans *inter alia* in testes, brain, small intestine, skeletal muscle, heart, lung, thymus and spleen. The highest expression was found in the brain, small intestine, kidney, prostate, colon, and spleen (Fisher *et al.*, *J. Biol. Chem.*, **1998**, 273 (25), 15559-15564; Wang *et al.*, *Gene*, **2003**, 314, 15-27). The gene for human PDE9A is located on chromosome 21q22.3 and comprises 21 exons. 4 alternative splice variants of PDE9A have been identified (Guipponi *et al.*, *Hum. Genet.*, **1998**, 103, 386-392). Classical PDE inhibitors do not inhibit human PDE9A. Thus, IBMX, dipyridamole, SKF94120, rolipram and vinpocetine show no inhibition on the isolated enzyme in concentrations of up to 100 micromolar. An  $IC_{50}$  of 35 micromolar has been demonstrated for zaprinast (Fisher *et al.*, *J. Biol. Chem.*, **1998**, 273 (25), 15559-15564).

Murine PDE9A was cloned and sequenced in 1998 by Soderling *et al.* (*J. Biol. Chem.*, **1998**, 273 (19), 15553-15558). This has, like the human form, high affinity for cGMP with a  $K_m$  of 70 nanomolar. Particularly high expression was found in the

mouse kidney, brain, lung and liver. Murine PDE9A is not inhibited by IBMX in concentrations below 200 micromolar either; the IC<sub>50</sub> for zaprinast is 29 micromolar (Soderling *et al.*, *J. Biol. Chem.*, **1998**, 273 (19), 15553-15558). It has been found that PDE9A is strongly expressed in some regions of the rat brain. These include

5 olfactory bulb, hippocampus, cortex, basal ganglia and basal forebrain (Andreeva *et al.*, *J. Neurosci.*, **2001**, 21 (22), 9068-9076). The hippocampus, cortex and basal forebrain in particular play an important role in learning and memory processes. As already mentioned above, PDE9A is distinguished by having particularly high affinity for cGMP. PDE9A is therefore active even at low physiological

10 concentrations, in contrast to PDE2A (Km=10 micromolar; Martins *et al.*, *J. Biol. Chem.*, **1982**, 257, 1973-1979), PDE5A (Km=4 micromolar; Francis *et al.*, *J. Biol. Chem.*, **1980**, 255, 620-626), PDE6A (Km=17 micromolar; Gillespie and Beavo, *J. Biol. Chem.*, **1988**, 263 (17), 8133-8141) and PDE11A (Km=0.52 micromolar; Fawcett *et al.*, *Proc. Nat. Acad. Sci.*, **2000**, 97 (7), 3702-3707). In contrast to PDE2A

15 (Murashima *et al.*, *Biochemistry*, **1990**, 29, 5285-5292), the catalytic activity of PDE9A is not increased by cGMP because it has no GAF domain (cGMP-binding domain via which the PDE activity is allosterically increased) (Beavo *et al.*, *Current Opinion in Cell Biology*, **2000**, 12, 174-179). PDE9A inhibitors may therefore lead to an increase in the baseline cGMP concentration.

20 This outline will make it evident that PDE9A engages into specific physiological processes in a characteristic and unique manner, which distinguish the role of PDE9A characteristically from any of the other PDE family members.

## OBJECTIVE OF THE INVENTION

25 The above cited prior art makes it evident that changes in the substitution pattern of pyrazolopyrimidinones result in interesting changes concerning biological activity, respectively changes in the affinity towards different target enzymes.

Therefore it is an objective of the present invention to provide compounds that effectively modulate PDE9A for the purpose of the development of a medicament, in particular in view of diseases, the treatment of which is accessible via PDE9A modulation.

30

It is another objective of the present invention to provide compounds that are useful for the manufacture of a medicament for the treatment of CNS disorders.

Yet another objective of the present invention is to provide compounds which show a better side effect profile compared to the compounds of the prior art.

- 5 Another objective of the present invention is to provide compounds that have a favourable selectivity profile in favour for PDE9A inhibition over other PDE family members and by this may provide advantage over the prior art compounds.

Yet another objective is to provide such a medicament not only for treatment but also for prevention or modification of the corresponding disease.

$x = 0, 1, 2, 3$  or  $4$ , preferably  $x = 0, 1$  or  $2$ , more preferably  $x = 0, 1$  and more preferably  $x = 0$ ; if not specified otherwise in the context;

$y = 0$ , or  $1$ , preferably  $y = 0$ , if not specified otherwise in the context;

with the proviso for each applicable embodiment of formula I of the invention - such  
10 as for example embodiments that comprise Hc<sup>1</sup> and Hc<sup>3</sup> - that

if Hc is oxetanyl, which is bound via the carbon atom next to the oxygen of the oxetanyl, there is no substituent attached to said carbon atom via a  $-CH_2-$  spacer.

15 The values of  $x$  and  $y$  are independent from each other.

The index symbols  $i, j, k, l, m, n$  in  $R^{1.j}, R^{2.k}$  etc. are indices, each of which shall have the meaning of an integer figure:  $1, 2, 3$ , etc. so that each  $R^{1.j}, R^{2.k}$  etc. represents a characterised, individual embodiment of the corresponding substituents for which  
20  $R^{1.j}, R^{2.k}$  etc. are the definitions.

So given the above definitions, a generic genus of compounds according to formula I is fully characterised by the term  $(\underline{Hc}^i R^{1.j} R^{2.k} R^{3.l} R^{4/5.m} R^{10.n})$  if for each letter  $i, j, k, l, m$  and  $n$  an individual figure is given whereby – if not indicated otherwise in a specific context - for each such embodiment  $(\underline{Hc}^i R^{1.j} R^{2.k} R^{3.l} R^{4/5.m} R^{10.n})$   $x$  shall be  
25  $0, 1, 2, 3$  or  $4$ , preferably  $x = 0, 1$  or  $2$  and  $y$  shall be  $0$  or  $1$  and with the proviso for each applicable embodiment of formula I of the invention that if Hc is oxetanyl, which is bound via the carbon atom next to the oxygen of the oxetanyl, there is no substituent attached to said carbon atom via a  $-CH_2-$  group.

In other words, each embodiment ( $\underline{\text{Hc}}^i \text{R}^{1.j} \text{R}^{2.k} \text{R}^{3.l} \text{R}^{4/5.m} \text{R}^{10.n}$ ) represents a fully characterised genus or subset genus according to the general formula I, i.e. a generic genus of compounds that is subject of the present invention.

- 5 Such embodiment defines the variables  $\underline{\text{Hc}}$ ,  $\text{R}^1$ ,  $\text{R}^2$ ,  $\text{R}^3$ ,  $\text{R}^4$ ,  $\text{R}^5$  and if applicable  $\text{R}^{10}$  of formula I and wherein – if not in a specific context indicated otherwise -  $x$  shall be 0, 1, 2, 3 or 4, preferably being 0, 1 or 2 and  $y$  shall be 0 or 1 and with the proviso for each applicable embodiment of formula I of the invention that if  $\underline{\text{Hc}}$  is oxetanyl, which is bound via the carbon atom next to the oxygen of the oxetanyl, there is no
- 10 substituent attached to said carbon atom via a  $-\text{CH}_2-$  group.

In a **1st general aspect** of the present invention, the compound or compounds of the present invention is (are) defined by the following embodiment according to the general formula I characterised by

with

$x$  independently from of any  $y$ :  $x = 0, 1, 2, 3$  or  $4$ , preferably  $x = 0, 1$  or  $2$

$y$  independently of any  $x$ :  $y = 0$  or  $1$ ,

and pharmaceutically acceptable salts and/or solvates and/or tautomeres etc.

20 thereof;

with the proviso that

if  $\underline{\text{Hc}}$  is oxetanyl, which is bound via the carbon atom next to the oxygen of the oxetanyl, there is no substituent attached to said carbon atom via a  $-\text{CH}_2-$

25 spacer.

According to the above, this means that the 1st aspect of the present invention is related to compounds according to general formula I

with

5 Hc as defined by Hc<sup>1</sup>;

$R^1$  as defined by  $R^{1.0.1}$ ;

$R^2$  as defined by  $R^{2.0.1}$ ;

$R^3$  as defined by  $R^{3.1}$ ;

$R^4$  and  $R^{4/}$  as defined by  $R^{4/5.1}$ ;

10  $R^{10}$  as defined by  $R^{10.0.1}$ ;

$x$  independently from of any  $y$ :  $x$  being 0, 1, 2, 3 or 4, preferably  $x = 0, 1$  or 2;

$y$  independently of any  $x$ :  $y = 0$  or 1;

and pharmaceutically acceptable salts and/or solvates and/or tautomeres etc. thereof;

15 with the proviso that

if Hc is oxetanyl, which is bound via the carbon atom next to the oxygen of the oxetanyl, there is no substituent attached to said carbon atom via a -CH<sub>2</sub>-spacer.

Thus this **1st aspect** of the inventions is defined as a compound according to general formula I

These 18 main aspects of the inventions, subgroups thereof and some further other aspects of the invention are listed as elements of the following matrix 0 and matrix I which make reference to the notation ( $\underline{\text{Hc}}^i \text{R}^{1,j} \text{R}^{2,k} \text{R}^{3,l} \text{R}^{4/5,m} \text{R}^{10,n}$ ), the reading of which is as defined above, i.e. together with general formula I and the remaining features like x, y, as outlined directly below said matrix 0 or matrix I.

Matrix 0 and matrix I show in the right hand column the embodiments ( $\underline{Hc}^i R^{1,j} R^{2,k} R^{3,l} R^{4/5,m} R^{10,n}$ ) of the invention according to general formula I that are considered preferred, independent and separable of each other, i.e. individual aspects of the invention. The left hand column provides a reference number to such embodiments.

- 5 The embodiments or elements are listed in the order from less preferred to most preferred, the preference of the embodiments is ascending with the reference number. This means that the embodiment, which is presented by the matrix element in the last row, last entry of matrix 0 or matrix I is the most preferred embodiment, while the embodiments of matrix I are preferred over the embodiments of matrix 0.
- 10 Aspects 1 to 18 are the main aspects of the invention.

## USED TERMS AND DEFINITIONS

Terms not specifically defined herein should be given the meanings that would be given to them by a person skilled in the art in light of the disclosure and the context. Examples include that specific substituents or atoms are presented with their 1 or 2 letter code, like H for hydrogen, N for nitrogen, C for carbon, O for oxygen, S for sulphur and the like. Optionally but not mandatorily the letter is followed by a hyphen to indicate a bond. As used in the specification, unless specified to the contrary, the following terms have the meaning indicated and the following conventions are adhered to.

In the groups, radicals, or moieties defined below, the number of carbon atoms is often specified preceding the group, for example, C<sub>1-6</sub>-alkyl means an alkyl group or alkyl radical having 1 to 6 carbon atoms. In general, for groups comprising two or more subgroups, the last named group is the radical attachment point, for example, "thioalkyl" means a monovalent radical of the formula HS-alkyl-. If the term of a substituent starts or ends with a minus sign or hyphen, i.e. -. This sign emphasises the attachment point like in the aforementioned example HS-alkyl-, where the "alkyl" is linked to the group of which the HS-alkyl- is a substituent. Unless otherwise specified below, conventional definitions of terms control and conventional stable atom valences are presumed and achieved in all formulas and groups.

In general, all "**tautomeric forms and isomeric forms and mixtures**", whether individual geometric isomers or optical isomers or racemic or non-racemic mixtures of isomers, of a chemical structure or compound are intended, unless the specific stereochemistry or isomeric form is specifically indicated in the compound name or structure.

The term "**substituted**" as used herein explicitly or implicitly, means that any one or more hydrogen(s) on the designated atom is replaced with a member of the indicated group of substituents, provided that the designated atom's normal valence is not exceeded. In case a substituent is bound via a double bond, e.g. an oxo substituent, such substituent replaces two hydrogen atoms on the designated atom. The substitution shall result in a stable compound. "Stable" in this context preferably means a compound that from a pharmaceutical point of view is chemically and physically sufficiently stable in order to be used as an active pharmaceutical ingredient of a pharmaceutical composition.

If a substituent is not defined, it shall be hydrogen.

By the term "**optionally substituted**" is meant that either the corresponding group is substituted or it is not. Accordingly, in each occasion where this term is used, the non-substituted variation is a more pronounced aspect of the invention, i.e. preferably there are no such optional substituents.

The phrase "**pharmaceutically acceptable**" is employed herein to refer to those compounds, materials, compositions, and/or dosage forms which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, or other problem or complication, commensurate with a reasonable benefit/risk ratio.

As used herein, "**pharmaceutically acceptable salt(s)**" refer to derivatives of the disclosed compounds wherein the parent compound is modified by making acid or base salts thereof. Examples of pharmaceutically acceptable salts include, but are not limited to, mineral or organic acid salts of basic residues such as amines; alkali or organic salts of acidic residues such as carboxylic acids; and the like. The pharmaceutically acceptable salts include the conventional non-toxic salts or the

quaternary ammonium salts of the parent compound formed, for example, from non-toxic inorganic or organic acids. For example, such conventional non-toxic salts include those derived from inorganic acids such as hydrochloric acid, hydrobromic acid, sulfuric acid, sulfamic acid, phosphoric acid, nitric acid, and the like; and the salts prepared from organic acids such as acetic acid, propionic acid, succinic acid, glycolic acid, stearic acid, lactic acid, malic acid, tartaric acid, citric acid, ascorbic acid, pantoic acid, maleic acid, hydroxymaleic acid, phenylacetic acid, glutamic acid, benzoic acid, salicylic acid, sulfanilic acid, 2-acetoxybenzoic acid, fumaric acid, toluenesulfonic acid, methanesulfonic acid, ethane disulfonic acid, oxalic acid, isothionic acid, and the like. As the compounds of the present invention may have both, acid as well as basic groups, those compounds may therefore be present as internal salts too.

The pharmaceutically acceptable salts of the present invention can be synthesized from the parent compound which contains a basic or acidic moiety by conventional chemical methods. Generally, such salts can be prepared by reacting the free acid or base form of these compounds with a stoichiometric amount of the appropriate base or acid in water or in an organic solvent, or in a mixture of the two; generally, non-aqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile are preferred.

**"Prodrugs"** are considered compounds that release an active parent drug of the present invention in vivo when such prodrug is administered to a mammalian subject. Prodrugs according to the present invention are prepared by modifying functional groups present in the compound in such a way that these modifications are retransformed to the original functional groups under physiological conditions. Prodrugs include compounds of the present invention wherein a hydroxy, amino, or sulfhydryl group is bound to any group that, when the prodrug of the present invention is administered to a mammalian subject, is retransformed to free said hydroxyl, amino, or sulfhydryl group. Examples of prodrugs include, but are not limited to, acetate, formate and benzoate derivatives of alcohol and amine functional groups in the compounds of the present invention.

**“Metabolites”** are considered as derivatives of the compounds according to the present invention that are formed in vivo. Active metabolites are such metabolites that cause a pharmacological effect. It will be appreciated that metabolites of the compounds according to the present inventions are subject to the present invention as well, in particular active metabolites.

Some of the compounds may form **“solvates”**. For the purposes of the invention the term “solvates” refers to those forms of the compounds which form, in the solid or liquid state, a complex by coordination with solvent molecules. Hydrates are a specific form of solvates in which the coordination takes place with water. According to the present invention, the term preferably is used for solid solvates, such as amorphous or more preferably crystalline solvates.

**“Scaffold”**: The scaffold of the compounds according to the present invention is represented by the following core structure, the numeration of which is indicated in bold:

It will be evident for the skilled person in the art, that this scaffold can be described by its tautomeric “enol” form

In the context of the present invention both structural representations of the scaffold shall be considered the subject of the present invention, even if only one of the two representatives is presented. It is believed that for the majority of compounds under ambient conditions and therewith under conditions which are the relevant conditions for a pharmaceutical composition comprising said compounds, the equilibrium of the tautomeric forms lies on the side of the pyrazolopyrimidin-4-one representation. Therefore, all embodiments are presented as pyrazolopyrimidin-4-one-derivatives or more precisely as pyrazolo[3,4-d]pyrimidin-4-one derivatives.

- 10 **"Bonds"**: If within a chemical formula of a ring system or a defined group a substituent is directly linked to an atom or a group like "RyR" in below formula this shall mean that the substituent is only attached to the corresponding atom. If however from another substituent like "RxR" a bond is not specifically linked to an atom of the ring system but drawn towards the centre of the ring or group this means  
15 that this substituent "RxR" may be linked to any meaningful atom of the ring system / group unless stated otherwise.

- The bond symbol "-" (= minus sign) or the symbol "-\*" (= minus sign followed by an asterisk sign) stands for the bond through which a substituent is bound to the corresponding remaining part of the molecule / scaffold. In cases in that minus sign does not seem to be sufficiently clear, an asterisk is added to the bond symbol "-" in order to determine the point of attachment of said bond with the corresponding main part of the molecule / scaffold.
- 25 In general, the bond to one of the herein defined heterocycloalkyl, heterocyclyl or heteroaryl groups may be effected via a C atom or optionally an N atom.

In the present example it bridges the C<sub>1-n</sub>-cylcoalkyl with the oxygen like in “cyclopropyl-methyl-oxy-“. It will be evident, that in such cases “**C<sub>1-n</sub>-alkyl**” has the meaning of a “**C<sub>1-n</sub>-alkylene**” spacer like methylene, ethylene etc. The groups that are bridged by “**C<sub>1-n</sub>-alkyl**” may be bound to

In cases in which the term “**C<sub>2-n</sub>-alkenyl**” is used in the middle of two other groups / substituents, the analogue definition as for C<sub>1-n</sub>-alkyl applies.

5

The term “**C<sub>2-n</sub>-alkynyl**” denotes a branched or unbranched hydrocarbon group with 2 to n C atoms and at least one C≡C group (i.e. a carbon-carbon triple bond), wherein n preferably has a value selected from the group of 3, 4, 5, 6, 7, or 8, more preferably 3, 4, 5, or 6, more preferably 3 or 4. Examples of such groups include ethynyl, 1-propynyl, 2-propynyl, 1-butyne, 2-butyne, 3-butyne, 1-pentyne, 2-pentyne, 3-pentyne, 4-pentyne, 1-hexyne, 2-hexyne, 3-hexyne, 4-hexyne, 5-hexyne etc. As will be evident from the context, such **C<sub>2-n</sub>-alkynyl** group optionally can be substituted.

This definition applies for “**heteroaryl**” in any reasonable context within the present description in the absence of a further definition.

The term “**N-linked-pyridine-2-one**” used in this application denotes:

The term “**heterocycloalkyl**” within the context of the present invention denotes a saturated 3 to 8 membered, preferably 5-, 6- or 7-membered ring system or a 5-12 membered bicyclic ring system, which include 1, 2, 3 or 4 heteroatoms, selected from N, O, and/or S. Preferred are 1, 2, or 3 heteroatoms.

The preferred number of carbon atoms is 3 to 7 with 1, 2, 3 or 4 heteroatoms selected from N, O, and/or S. Such heterocycloalkyl groups are addressed as C<sub>3-7</sub>-heterocycloalkyl.

Preferred are saturated heterocycloalkyl rings with 5, 6, or 7 ring atoms, of which 1 or 2 are heteroatoms and the remaining are C-atoms.

Wherever C<sub>3-7</sub>-heterocycloalkyl- substituents are mentioned, the preferred embodiments thereof are 5-, 6-, or 7-membered cycles, more preferably monocycles. They include 1, 2, 3, or 4 heteroatoms, selected from N, O, and/or S, whereby 1 or 2 such heteroatoms are preferred, more preferably 1 such heteroatom.

5

Preferred example for heterocycloalkyl include morpholinyl, piperidinyl, piperazinyl, thiomorpholinyl, oxathianyl, dithianyl, dioxanyl, pyrrolidinyl, tetrahydrofuranyl, dioxolanyl, oxathiolanyl, imidazolidinyl, tetrahydropyranyl, pyrrolinyl, tetrahydrothienyl, oxazolidinyl, homopiperazinyl, homopiperidinyl, homomorpholinyl, homothiomorpholinyl, azetidiny, 1,3-diazacyclohexanyl or pyrazolidinyl group.

10

This definition applies for "**heterocycloalkyl**" in any reasonable context within the present description in the absence of a further specific definition.

15

The term "**heterocyclyl**" specifically is used to define the group **Hc** in formula I and formulae which are derived thereof and therefore will be independently used from the definition of "heterocycloalkyl". However, the definitions for "heterocycloalkyl" shall be comprised within the definition for "heterocyclyl". **Hc** is a group which is or at least comprises a non-aromatic heterocycloalkyl group which is bound to the scaffold.

20

Within the context of the present invention and as used herein, specifically within the context of **Hc**, "**heterocyclyl**" means a non-aromatic monocyclic, bicyclic or tricyclic ring system, whereby the ring members are carbon atoms and at least one, preferably one to three heteroatom(s) selected from the group of nitrogen, oxygen, or sulphur, the sulphur being part the group -S(O)<sub>r</sub> - with r being 0, 1 or 2. Such ring system may further be bridged. Such systems also will be called heteromonocyclic, heterobicyclic, or heterotricyclic ring system within the present context.

25

30

This heterocyclyl group may be saturated or partly unsaturated, whereby in systems with more than one ring system, at least one of them is not aromatic. This at least one non aromatic ring system comprises said at least one heteroatom.

This heterocyclyl group may be bound to the scaffold in more than one way. If no particular bonding arrangement is specified, then all possible arrangements are

intended. For example, the term "tetrahydropyranyl" includes 2-, 3-, or 4-tetrahydropyranyl and the like. In cases with more than one ring system, the bonding to the scaffold is via at least one ring atom of the non aromatic ring system comprising at least one heteroatom. Preferably this heterocyclyl-group is bound to the scaffold via a nitrogen atom or one of the saturated carbon atoms in said ring system. More preferably it is attached to the scaffold via a carbon atom of the non-aromatic heterocyclic ring system.

Such heterocyclyl group may be fused, respectively annelated, with a cycloalkyl, another heterocyclic group, an aromatic ring system, such as phenyl or may be part of a spirocyclic system. In a fused or annelated system, the two ring systems share a bond between two adjacent ring atoms. In the spiro variation, the two ring systems have one ring atom in common.

The monoheterocyclic ring systems within this definition are non-aromatic monocyclic ring systems, in which at least one, preferably one to three, of the carbon atoms have been replaced with a heteroatom such as nitrogen, oxygen, or sulphur, the sulphur being part the group  $-S(O)_r$  - with r being 0, 1 or 2 comprises preferably 4 to 8 ring atoms. Within this context preferred are 5-, 6- or 7-membered, saturated or at least partly unsaturated heterocyclic rings

The heterobicyclic ring systems within this definition are bicyclic ring systems with at least one, preferably one to three, of the carbon atoms have been replaced with a heteroatom such as nitrogen, oxygen, or sulphur, the sulphur being part the group  $-S(O)_r$  - with r being 0, 1 or 2; the ring system has at least one non-aromatic ring, which comprises said at least one heteroatom, and the bicyclic ring system comprises preferably 7 to 12 ring atoms. Within this context preferred are 8-, 9- or 10-membered, saturated or at least partly unsaturated heterocyclic rings.

The heterotricyclic ring systems within this definition are tricyclic systems of annelated monocycles, in which at least one, preferably one to three, of the carbon atoms have been replaced with a heteroatom such as nitrogen, oxygen, or sulphur, the sulphur being part the group  $-S(O)_r$  - with r being 0, 1 or 2; the ring system has

at least one non-aromatic ring, which comprises said at least one heteroatom, and the tricyclic ring system comprises preferably 7 to 14 ring atoms.

By the term spirocyclic system as mentioned within this definition, are meant preferably 5-10 membered, spirocyclic rings which may optionally contain 1, 2 or 3 heteroatoms, selected from among oxygen, sulphur, and nitrogen. Such systems optionally may be annelated with an aromatic ring system such as phenyl.

The order of preference of heterocyclic ring systems is: monocyclic ring systems are more preferred than bicyclic ring systems, which are more preferred than tricyclic ones.

Examples for such heterocyclic **Hc** groups according to the present invention are the following groups:

, wherein -\* stands for the bond by which said group is bound to the nitrogen atom of the scaffold, that is numbered as 1.

- 5 The above definition applies for “**heterocyclyl**” in any reasonable context within the present description in the absence of a further definition.

The term “**oxo**” denotes an oxygen atom as substituent that is bonded by a double bond, preferably it is bonded to a C-atom. In case oxo is used as a substituent, the oxo replaces two hydrogen atoms of the corresponding atom of the unsubstituted compound.

5

The following schemes shall illustrate a process to manufacture the compounds of the present invention by way of example:

**Scheme 1**

10

Scheme 1: In a first step 2-ethoxymethylene-malononitrile is condensed with mono-substituted hydrazines by heating in an appropriate solvent like ethanol in the presence of a base (e.g. triethylamine) to form 5-amino-1H-pyrazole-4-carbonitriles.

These compounds are converted in a second step to the corresponding amides, e.g. by treatment of an ethanolic solution with ammonia (25 % in water) and hydrogen peroxide (35 % in water). In a third step, heating with carboxylic esters under basic conditions (e.g. sodium hydride in ethanol) or carboxylic acids with an activation reagent (e.g. polyphosphoric acid) leads to pyrazolo[3,4-d]pyrimidin-4-ones as final products [cf., for example, A. Miyashita *et al.*, *Heterocycles* **1990**, 31, 1309ff].

Schemes 2 and 3 illustrate alternative methods to prepare the final compounds: in these exemplified manufacturing methods 5-amino-1H-pyrazole-4-carboxylic acid amides are condensed in a first step with an appropriate ester derivative followed in a second step by alkylation with suitable electrophiles.

### Scheme 4

5 Scheme 5 illustrates an alternative method to prepare the final compounds: in the exemplified manufacturing method 5-amino-1H-pyrazole-4-carboxylic acid amides are condensed in a first step with (2-cyano-phenyl)-acetic acid ester derivatives followed in

a second step by transformation of the nitrile group into a 5-membered heteroaromatic group.

Further alternative processes for preparing pyrazolo[3,4-d]pyrimidin-4-ones are known in the art and can likewise be employed for synthesizing the compounds of the invention (see, for example: P. Schmidt *et al.*, *Helvetica Chimica Acta* **1962**, 189, 1620ff.).

10

The mono-substituted hydrazine derivatives, that are used in step 1 of scheme 1 can be prepared either by nucleophilic displacement on the corresponding mesylate derivative (scheme 6) or by reduction of the hydrazone intermediate as depicted in scheme 7 [cf.,

for example, J.W. Timberlake *et al.*, "Chemistry of Hydrazo-, Azo-, and Azoxy Groups"; Patai, S., Ed.; 1975, Chapter 4; S. C. Hung *et al.*, *Journal of organic Chemistry* 1981, 46, 5413-5414].

## PHARMACEUTICAL COMPOSITIONS

Medicaments for administration comprise a compound according to the present invention in a therapeutically effective amount. By "therapeutically effective amount" it is meant that if the medicament is applied via the appropriate regimen adapted to the patient's condition, the amount of said compound of formula (I) will be sufficient to effectively treat, to prevent or to decelerate the progression of the corresponding disease, or otherwise to ameliorate the estate of a patient suffering from such a disease. It may be the case that the "therapeutically effective amount" in a monotherapy will differ from the "therapeutically effective amount" in a combination therapy with another medicament.

The dose range of the compounds of general formula (I) applicable per day is usually from 0.1 to 5000 mg, preferably 0.1 to 1000 mg, preferably from 2 to 500 mg, more preferably from 5 to 250 mg, most preferably from 10 to 100 mg. A dosage unit (e.g. a tablet) preferably contains between 2 and 250 mg, particularly preferably between 10 and 100 mg of the compounds according to the invention.

The actual pharmaceutically effective amount or therapeutic dosage will of course depend on factors known by those skilled in the art such as age, weight, gender or other condition of the patient, route of administration, severity of disease, and the like.

The compounds according to the invention may be administered by oral, parenteral (intravenous, intramuscular etc.), intranasal, sublingual, inhalative, intrathecal, topical or rectal route. Suitable preparations for administering the compounds according to the present invention include for example patches, tablets, capsules, pills, pellets, dragees, powders, troches, suppositories, liquid preparations such as solutions,

suspensions, emulsions, drops, syrups, elixirs, or gaseous preparations such as aerosols, sprays and the like. The content of the pharmaceutically active compound(s) should be in the range from 0.05 to 90 wt.-%, preferably 0.1 to 50 wt.-% of the composition as a whole. Suitable tablets may be obtained, for example, by mixing the active substance(s) with known excipients, for example inert diluents such as calcium carbonate, calcium phosphate or lactose, disintegrants such as corn starch or alginic acid, binders such as starch or gelatine, lubricants such as magnesium stearate or talc and/or agents for delaying release, such as carboxymethyl cellulose, cellulose acetate phthalate, or polyvinyl acetate. The tablets may also comprise several layers.

Coated tablets may be prepared accordingly by coating cores produced analogously to the tablets with substances normally used for tablet coatings, for example collidone or shellac, gum arabic, talc, titanium dioxide or sugar. To achieve delayed release or prevent incompatibilities the core may also consist of a number of layers. Similarly the tablet coating may consist of a number of layers to achieve delayed release, possibly using the excipients mentioned above for the tablets.

Syrups or elixirs containing the active substances or combinations thereof according to the invention may additionally contain a sweetener such as saccharine, cyclamate, glycerol or sugar and a flavour enhancer, e.g. a flavouring such as vanillin or orange extract. They may also contain suspension adjuvants or thickeners such as sodium carboxymethyl cellulose, wetting agents such as, for example, condensation products of fatty alcohols with ethylene oxide, or preservatives such as p-hydroxybenzoates.

Solutions are prepared in the usual way, e.g. with the addition of isotonic agents, preservatives such as p-hydroxybenzoates or stabilisers such as alkali metal salts of ethylenediaminetetraacetic acid, optionally using emulsifiers and/or dispersants, while if water is used as diluent, for example, organic solvents may optionally be used as solubilisers or dissolving aids, and the solutions may be transferred into injection vials or ampoules or infusion bottles.

Capsules containing one or more active substances or combinations of active substances may for example be prepared by mixing the active substances with inert carriers such as lactose or sorbitol and packing them into gelatine capsules.

- 5 Suitable suppositories may be made for example by mixing with carriers provided for this purpose, such as neutral fats or polyethyleneglycol or the derivatives thereof.

Excipients which may be used include, for example, water, pharmaceutically acceptable organic solvents such as paraffins (e.g. petroleum fractions), vegetable  
10 oils (e.g. groundnut or sesame oil), mono- or polyfunctional alcohols (e.g. ethanol or glycerol), carriers such as e.g. natural mineral powders (e.g. kaolins, clays, talc, chalk), synthetic mineral powders (e.g. highly dispersed silicic acid and silicates), sugars (e.g. cane sugar, lactose and glucose), emulsifiers (e.g. lignin, spent sulphite liquors, methylcellulose, starch and polyvinylpyrrolidone) and lubricants (e.g.  
15 magnesium stearate, talc, stearic acid and sodium lauryl sulphate).

For oral use the tablets may obviously contain, in addition to the carriers specified, additives such as sodium citrate, calcium carbonate and dicalcium phosphate together with various additional substances such as starch, preferably potato starch,  
20 gelatin and the like. Lubricants such as magnesium stearate, sodium laurylsulphate and talc may also be used to produce the tablets. In the case of aqueous suspensions the active substances may be combined with various flavour enhancers or colourings in addition to the abovementioned excipients.

- 25 The dosage of the compounds according to the invention is naturally highly dependent on the method of administration and the complaint which is being treated. When administered by inhalation the compounds of formula (I) are characterised by a high potency even at doses in the microgram range. The compounds of formula (I) may also be used effectively above the microgram range. The dosage may then be in  
30 the gram range, for example.

The combination may be also provided separately, in form of a free combination, i.e the compounds of the present invention are provided in one dosage form and one or more of the above mentioned combination partners is provided in another dosage form. These two dosage forms may be equal dosage forms, for example a co-administration of two tablets, one containing a therapeutically effective amount of the compound of the present invention and one containing a therapeutically effective amount of the above mentioned combination partner. It is also possible to combine different administration forms, if desired. Any type of suitable administration forms may be provided.

The compound according to the invention, or a physiologically acceptable salt thereof, in combination with another active substance may be used simultaneously or at staggered times, but particularly close together in time. **BIOLOGICAL ASSAY**

The in vitro effect of the compounds of the invention can be shown with the following biological assays.

15 PDE9A2 assay protocol:

The PDE9A2 enzymatic activity assay was run as scintillation proximity assay (SPA), in general according to the protocol of the manufacturer (Amersham Biosciences, product number: TRKQ 7100).

- As enzyme source, lysate (PBS with 1 % Triton X-100 supplemented with protease inhibitors, cell debris removed by centrifugation at 13.000 rpm for 30 min) of SF 9 cell expressing the human PDE9A2 was used. The total protein amount included in the assay varied upon infection and production efficacy of the SF9 cells and lay in the range of 0.1 – 100 ng.

25 In general, the assay conditions were as follows:

- total assay volume: 40 microliter
- protein amount: 0.1 – 50 ng
- substrate concentration (cGMP): 20 naomolar; ~1 mCi/l
- incubation time: 60 min at room temperature
- 30 • final DMSO concentration: 0.2 - 1 %

The assays were run in 384-well format. The test reagents as well as the enzyme and the substrate were diluted in assay buffer. The assay buffer contained 50 mM

Tris, 8.3 mM MgCl<sub>2</sub>, 1.7 mM EGTA, 0.1 % BSA, 0.05 % Tween 20; the pH of assay buffer was adjusted to 7.5. The reaction was stopped by applying a PDE9 specific inhibitor (e.g. compounds according to WO04099210) in excess.

5 **Determination of % inhibition:**

The activity of the positive control (minus the negative control = background) is set to 100 % and activity in the presence of test compound is expressed relative to these 100 %. Within this setting, an inhibition above 100 % might be possible due to the nature of the variation of the positive control within the assay, however, in this case  
10 the reported % inhibition had been adjusted to 100 %.

**Determination of IC<sub>50</sub>:**

IC<sub>50</sub> can be calculated with GraphPadPrism or other suited software setting the  
15 positive control as 100 and the negative control as 0. For calculation of IC<sub>50</sub> dilutions of the test compounds (substrates) are to be selected and tested following the aforementioned protocol.

**Data**

20 In the following, % inhibition data will illustrate that the compounds according to the present invention are suited to inhibit PDE9 and thus provide useful pharmacological properties. The examples are not meant to be limiting. The table also provides IC<sub>50</sub> values. The values are presented as being within a nanomolar range (nM), i.e. within the range of either 1 nanomolar to 100 nanomolar or within the range of 101  
25 nanomolar to 1200 nanomolar. The specific IC<sub>50</sub> value is within said range. The example number refer to the final examples as outlined in the section **Exemplary embodiments** (see also aspect 18 of the invention).

All data are measured according to the procedure described herein.

### **General comment concerning the presentation of the structures**

Some compounds have one or more chiral centres. The depicted structure will not necessarily show all the possible stereochemical realisation of the compound but only one. However, in such cases a term like “cis-racemic mixture” is depicted next to the structure in order to point to the other stereochemical options.

An example is given for Example 7D, below. The presented structural formula is

Cis - racemic mixture

The added term “cis - racemic mixture” points to the second stereochemical option:

This principle applies to other depicted structures as well.

### **Synthesis**

In the following the manufacture of compounds which exemplify the present invention is described. In case the process of manufacture of a specific compound has not been disclosed literally, the skilled person in the art will find a description of analogue procedures within these descriptions which he can follow in principle. At some places it is said, the examples can be prepared in analogy to another example. If reference should be made to such an “analogue process” the reactions conditions are about the same, even if molar ratios of reagents and educts might to be adjusted. It also will be evident that starting materials within a described process can be varied chemically to achieve the same results, i.e. if a condensation reaction of an ester is described, in that the alcoholic component is a leaving group but not subject of the product, this alcoholic component may vary without significant changes of the procedure as such.

### **Starting compounds:**

Example 1A

A solution of 70 g (201 mmol) carbethoxymethylene triphenylphosphorane in 300 mL diethyl ether was cooled to 0°C and 25 g (198 mmol) 1.,1,1-trifluorobutanone was added. The solution was warmed to room temperature and stirred over night. The reaction mixture was filtered and the filtrate was concentrated under reduced pressure (700 mbar and 40°C bath temperature). The residue was purified by vacuum distillation (170 mbar and 130°C bath temperature, main fraction: 95-96°C). 29 g (75 %) of the product were obtained as colourless oil.

While being stirred, a solution of 1.3 ml (8.99 mmol) trimethylphosphono acetate in 10 ml THF was added. The mixture was stirred for 1 h at the same temperature. After this, a solution of 4,4-difluorocyclohexanone in 10 ml THF was added at 0°C. The mixture was allowed to warm to room temperature and stirred for 14 h. THF and water was added and the THF evaporated. The remainder was diluted with ethyl acetate, washed with water and saturated sodium hydrogen carbonate solution and evaporated to yield 1.49 g (95 %) of the product.

The following examples 1B, 1C, 1D, 1E, 2A, 2B, 2C and 2D show how the racemic acids 3-trifluoromethyl-pentanoic acid and 3-trifluoromethyl-butyric acid can be transferred into the two enantiomeric forms of the free acid. The resolution can be done via separation of diastereomeric intermediates. The two pure enantiomeric forms of the free acid will be called enantiomer A, enantiomer B respectively. The corresponding diastereomeric intermediates will be called diastereomer A, diastereomer B respectively.

The same principle may be applied for enantiomeric resolution of other racemic mixtures if appropriate.

A solution of 1.00 g (5.32 mmol) 2-methoxy-5-bromopyridine in 10 mL anhydrous THF was cooled to  $-78^{\circ}\text{C}$  and n-BuLi (3.66 mL, 5.85 mmol, 1.6 M in hexane) was added. After 10 min at  $-78^{\circ}\text{C}$  1.18 g (6.38 mmol) 2-oxo-cyclohexyl-acetic acid ethyl ester was added and the mixture was warmed to  $25^{\circ}\text{C}$ . Water was added (1 mL) and the mixture was concentrated under reduced pressure. The residue was purified by preparative HPLC (eluent A: water + 0.13 % TFA, eluent B: acetonitrile). 370 mg (28 %) of the product were obtained as an oil.

HPLC-MS (Method 1):  $R_t$ : 1.23 min

MS (ESI pos):  $m/z = 248$  ( $M+H$ )<sup>+</sup>

Example 18A, cis, racemic mixture

380 mg (1.54 mmol) of Example 17A was mixed with 5 mL methanol, 50 mg Pd/C (10 %) was added, and the mixture was hydrogenated at room temperature (8h, 50 psi). The reaction mixture was filtered and the residue was washed with methanol. The solvent was evaporated under reduced pressure. 340 mg (89 %) of product were obtained as colourless oil and used without further purification.

HPLC-MS (Method 1):  $R_t$ : 1.01 min

MS (ESI pos):  $m/z = 250$  ( $M+H$ )<sup>+</sup>

Exemplary embodiments:

Example 1

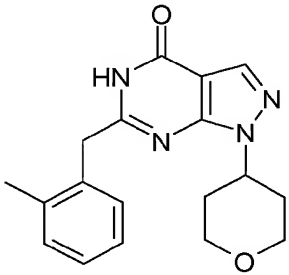

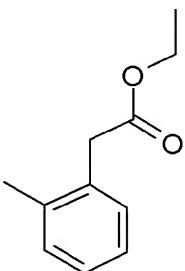

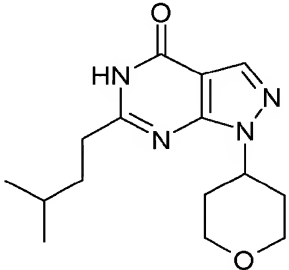

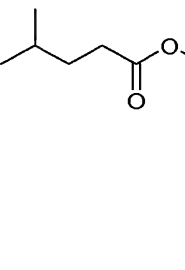

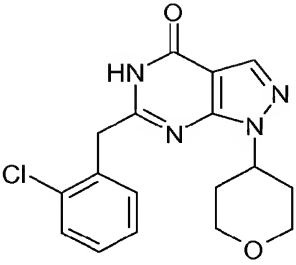

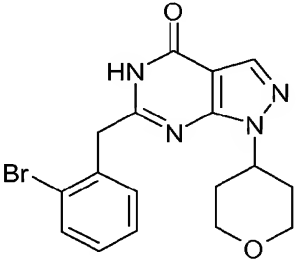

100 mg (0.48 mmol) of Example 11B were dissolved in 5 mL of absolute ethanol, 400 mg (2.17 mmol) of Example 5V and 100 mg (2.5 mmol) of sodium hydride (60 % suspension in mineral oil) were added. The reaction mixture was heated to 150°C for 30 min in a microwave oven. Cooling to room temperature was followed by evaporation of the solvent under reduced pressure. The residue was purified by preparative HPLC (eluent A: water + 0.13 % TFA, eluent B: acetonitrile). 29 mg (18 %) of the product were obtained as a white solid.

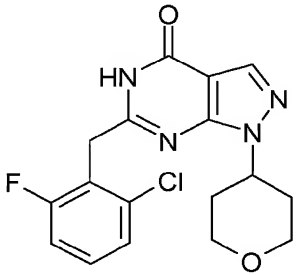

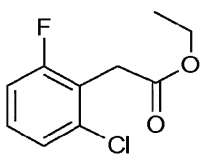

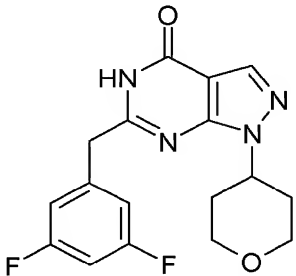

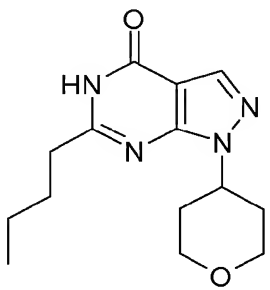

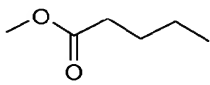

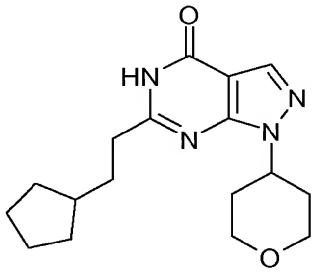

HPLC-MS (Method1):  $R_t$ : 1.08 min

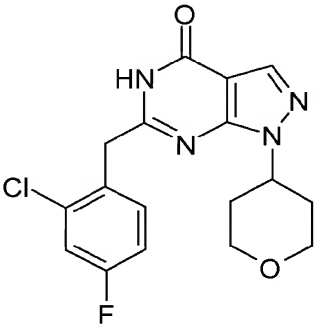

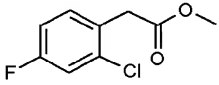

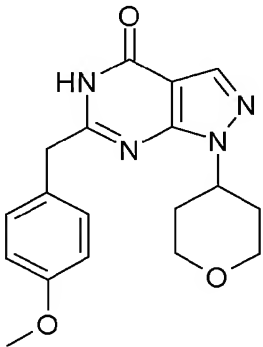

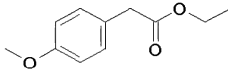

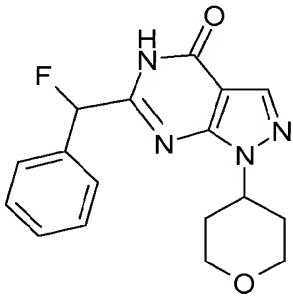

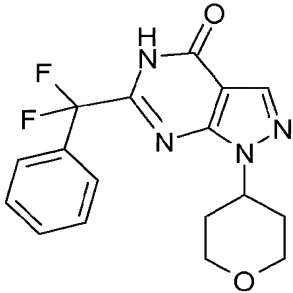

MS (ESI pos):  $m/z = 331 (M+H)^+$

#### Example 41

80 mg (0.38 mmol) of Example 11B were dissolved in 1 mL of absolute ethanol, 262 mg (1.52 mmol) of ethyl tetrahydropyran-4-yl-acetate, and 45.1 mg (1.10 mmol) of sodium hydride (60 % suspension in mineral oil) were added. The reaction mixture was heated to 150°C for 40 min in a microwave oven. Cooling to 20°C was followed by evaporation of the solvent under reduced pressure. The residue was treated with water (10 mL), acidified with HCl (10 % in water) and extracted two times with dichloromethane (2 mL). The organic layer was dried over sodium sulphate, filtered and the filtrate was concentrated under reduced pressure. The residue was triturated with ether to give 65 mg (53.7 %) of the product as a white solid.

Example 133

6-(2-Ethyl-butyl)-1-(tetrahydro-pyran-4-yl)-1,5-dihydro-pyrazolo[3,4-d]pyrimidin-4-one

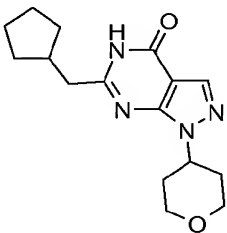

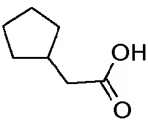

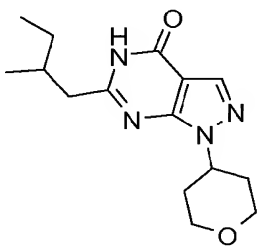

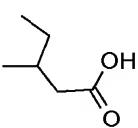

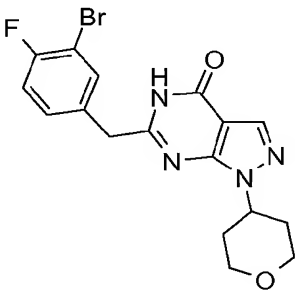

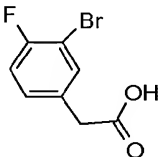

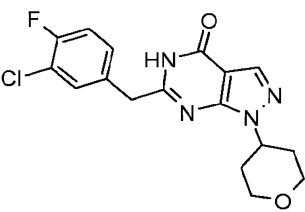

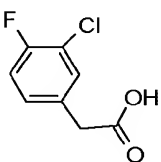

Example 11B (0.1 g, 0.48 mmol) was mixed with polyphosphoric acid (1.0 g) and 2-(trifluoromethoxy)phenylacetic acid (248 mg, 1.9 mmol) was added. The mixture was heated to 120°C during 16 hours. Temperature was lowered to 20°C and the pH value was adjusted to 7 by addition of ammonia (30 % solution in water). The aqueous phase was extracted with dichloromethane (2 x 20 mL) and the organic phase was dried over sodium sulphate. The crude mixture was purified by flash chromatography. Eluent: hexane/ethyl acetate 40/60.

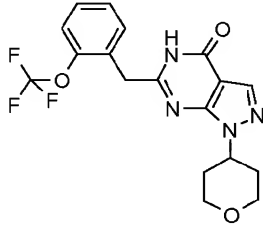

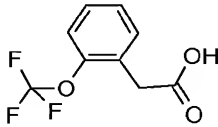

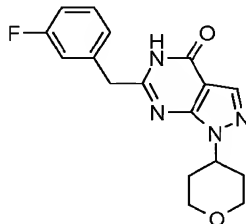

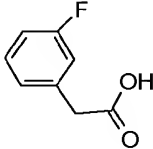

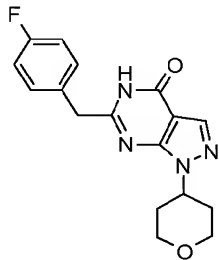

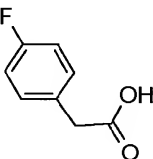

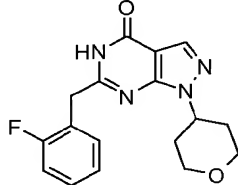

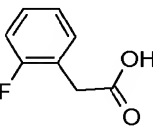

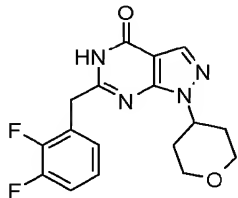

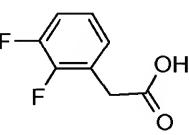

Obtained 23.5 mg (16 %) as a white solid

carbonate (439 mg, 1.35 mmol) were added. Dimethylformamide (5 ml), previously degassed, was then added, followed by N-N'-dimethylethylenediamine (47.87  $\mu$ l; 0.45 mmol). The reaction mixture was heated to 120 °C for three hours. The suspension was then filtered over a Celite pad; Celite was washed with DMF. The volume of the organic phase was reduced under reduced pressure and, afterwards, ammonium chloride saturated solution was added, followed by ethyl acetate. The phases were separated and the organic phase was washed with brine and then dried. The crude product was purified by SPE cartridge and the product obtained was further purified by SPE Stratosphere "PL-THIOL MP" to completely remove copper salts. Example 53 (100 mg, 0.298 mmol) and hydroxylamine (0.073 ml, 1.19 mmol) were mixed together in absolute ethanol (4 ml) in a 50 ml flask. The reaction mixture was refluxed for 3 hours before being worked up. The solvent was then removed under reduced pressure to obtain 120 mg (content 70%, 0.228 mmol) of N-Hydroxy-2-[4-oxo-1-(tetrahydro-pyran-4-yl)-4,5-dihydro-1H-pyrazolo[3,4-d]pyrimidin-6-ylmethyl]-benzamide as solid that was used as such in the next step.

N-Hydroxy-2-[4-oxo-1-(tetrahydro-pyran-4-yl)-4,5-dihydro-1H-pyrazolo[3,4-d]pyrimidin-6-ylmethyl]-benzamide (120 mg, content 70%; 0.228 mmol) was suspended in trimethylorthoacetate (5 ml) and acetic acid was added afterwards (1 ml); the mixture was heated to 100 °C for one hour. The mixture was cooled at room

temperature and the precipitation of a solid was observed. The filtrate was evaporated under reduced pressure; the crude product was purified by flash chromatography. The product was then triturated with diethyl ether. 24 mg of the desired compound were obtained (yield 26.6%).

Example 233

Example 12X (250 mg, 1.14 mmol) was dissolved in 20 ml of hot methanol. Alumina (neutral) was added and the solvent was then removed to give a white powder which was transferred into a 2 ml Wheaton vial; 5,6-Dihydro-2H-pyran-2-oxo was added followed by DMFe (1ml) and the vial was closed tightly. The suspension was heated to 80°C with orbital shaking during 4 days. The reaction was then filtered and the alumina was washed with methanol, ethyl acetate and dichloromethane; the organic solutions were combined and solvents removed under reduced pressure. The crude product was purified by flash chromatography.

Eluent: (gradient starting with n-hexane/ethyl acetate 9/1 to ethyl acetate (100%) followed by ethyl acetate/methanol 99/1 to 94/6). 70 mg of the desired compound were obtained as solid (19.3 %).
